Creating Containers with Bootstrap

Containers are the most basic layout element in Bootstrap and are required when using the grid system. Containers are basically used to wrap content with some padding. They are also used to align the content horizontally center on the page in case of fixed width layout.

Bootstrap provides three different types containers:

- `.container`, which has a max-width at each responsive breakpoint.
- `.container-fluid`, which has 100% width at all breakpoints.
- `.container-{breakpoint}`, which has 100% width until the specified breakpoint.

Creating Responsive Fixed-width Containers

You can simply use the `.container` class to create a responsive, fixed-width container. The width of the container will change at different breakpoints or screen sizes, as shown above.

Example

```
<div class="container">
    <h1>This is a heading</h1>
    <p>This is a paragraph of text.</p>
</div>
```

Creating Fluid Containers

You can use the `.container-fluid` class to create a full width container. The width of the fluid container will always be 100% irrespective of the devices or screen sizes.

Example

```
<div class="container-fluid">
    <h1>This is a heading</h1>
    <p>This is a paragraph of text.</p>
</div>
```
