Android is quite versatile and extends beyond the typical smartphone and tablet to a wide range of devices giving you an opportunity to build productive apps.

By developing Android apps, you can create software that users can download and use on their smartphones via the **Play Store.**

To develop Android apps, you typically use programming languages, **Kotlin** is the official android apps development.

Once your app is built and tested, you can publish it on the **Play Store**, making it available to a large audience, this increases your earnings/revenue.
