In Android, **activities** are a key component of the app's structure. Essentially, an **activity** represents a single screen or page in an Android app. Every time you interact with a new screen in an Android app, you're typically interacting with an **activity**. An activity provides a user interface (UI) where you can display information and interact with the user.

For example, on your phone:

- **Settings Activity**: When you open the settings app on your phone, you're interacting with an activity that lets you change system settings.
- **Messages Activity**: This activity displays all your messages in a conversation.
- **Compose Message Activity**: When you start writing a new message, this is another activity where you can type and send your text.

Creating an App in Android Studio

To get started, let's walk through the steps of creating a very basic Android app that displays "Hello World" on the screen.

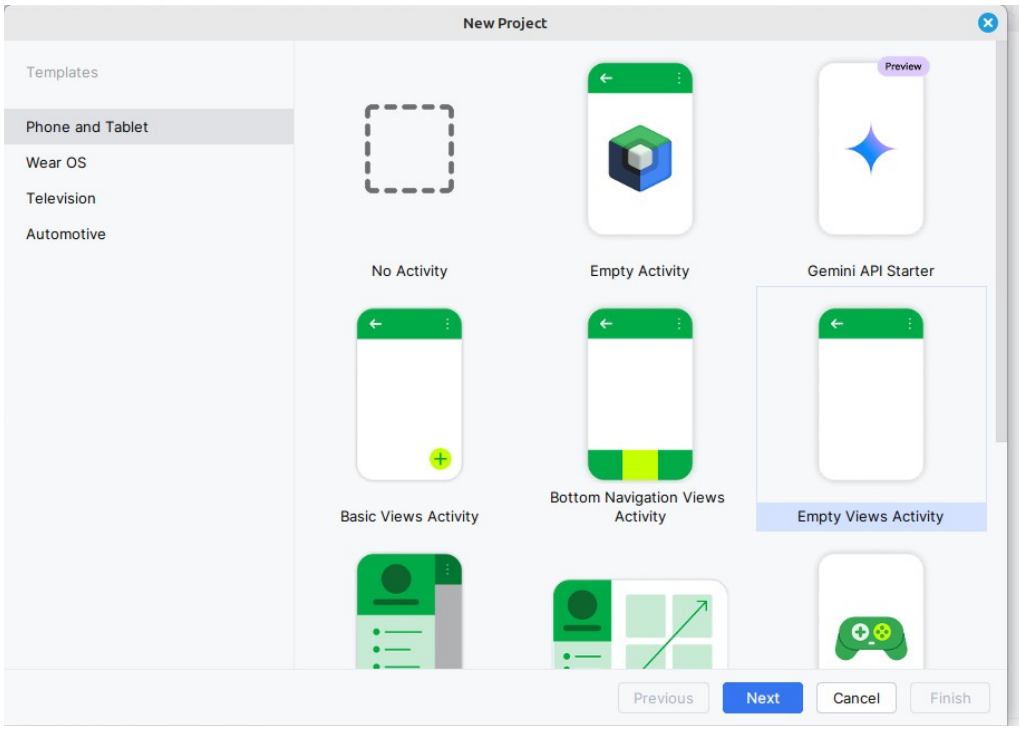

1. **Set up Android Studio**:
    - Make sure you have **Android Studio** installed. It's the official Integrated Development Environment (IDE) for Android app development.

Create a New Project:

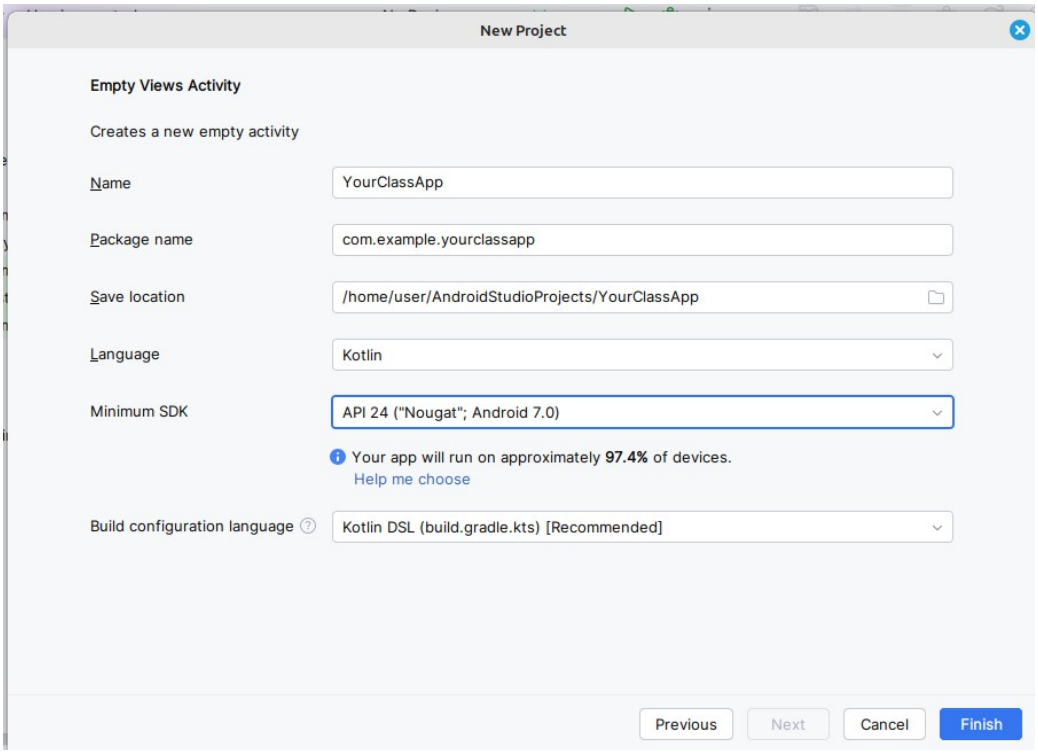

- Open Android Studio and click on **"Start a new Android Studio project."**
- **NB:** If you a project already open, Click on **File Menu – New - New Project**
- Choose the **"Empty Views Activity"** template for your app.
- Name your project (e.g., "**ClassNameApp**"), and choose a location to save it.
- Select a language (**Kotlin**).

Step 1. In Android Studio, Click on **File – New - New Project.**

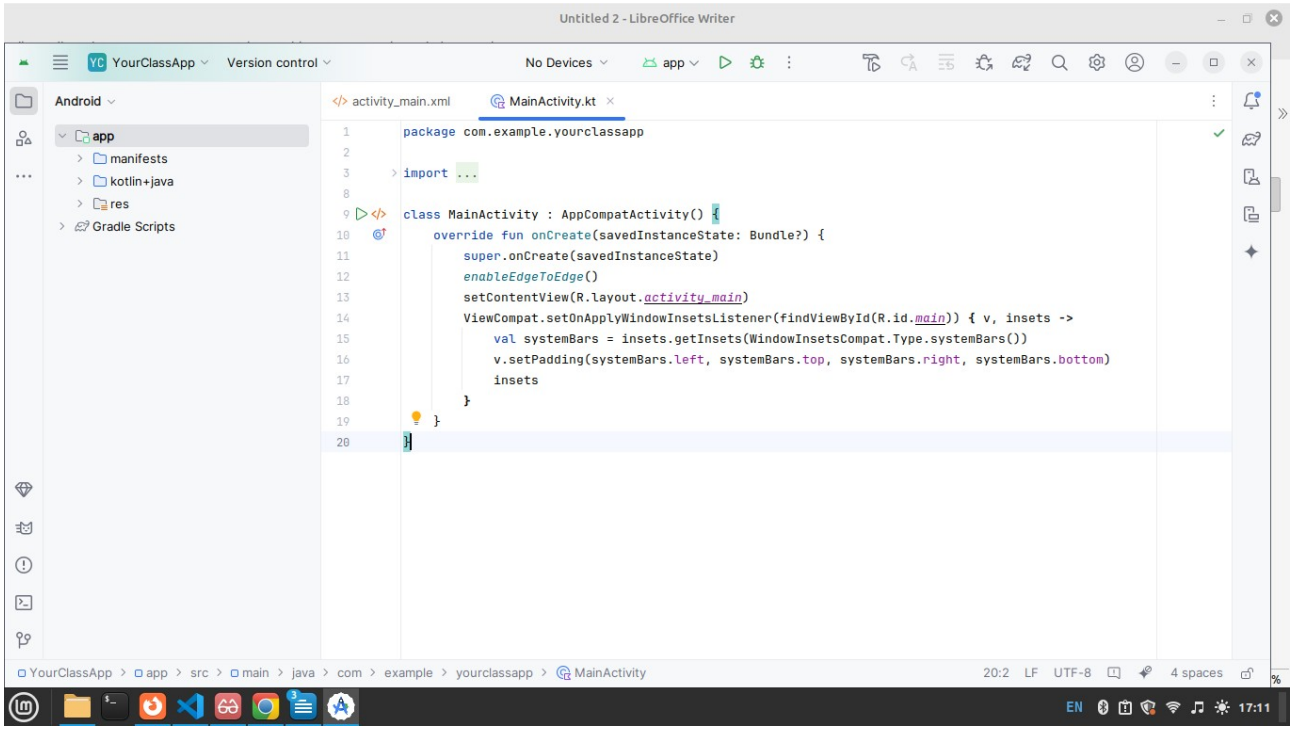

In below screen, Select **Empty Views Activity** in below

Step 2: Enter Your App Name(use **ClassNameApp**), Leave default package, Leave default location(But these can be changed). Choose minimum SDK(I choose SDK Version 24), Language Choose Kotlin.
See below screen, Click **Finish**

Step 3: App Is created, Expand the app on the left side.

Next, we look at app File Structure. **PDF003**
